Individual Project

Individual Project

- Students will work independently to design, implement and deploy Android Mobile app of their proposed applications.

- Each student is expected to apply best software development practices such as using software configuration management and select appropriate supporting tools.

Assessment of the Individual Projects

- Individual Project Proposal Submission on week 7 Sat
- Final Submission on week 14 Sat

    1. A video demonstrating the Android app running on a **physical** device
    2. Final report
    3. App source code & apk files

More details will be released in the Canvas Assignments section.

Proposal (1)

- The proposed apps **must be non-trivial**, ideally incorporating multiple significant features of the Android platform. The proposed app should satisfy at least one or two of the following categories:
  - humanitarian (i.e. it improves quality of life in some significant way)
  - monetizable (i.e. it could generate a profit)
- In the proposal, express the vision and scope of the proposed app.
- Competitive Analysis (who are competitors, how successful are they, how is your idea different)
- Proposal report format will be released in canvas.

Marketing (2)

For your individual app development project, you must create a marketing presentation that showcases your app's value and appeal, aiming to attract users or even investors.

This presentation can be in the form of a demo video, a website page (like a GitHub repo page), or social media posts (Twitter, Rednote, etc.). Your presentation should go beyond just simply demonstrating the app's functionality and should focus on:

1. **Target Audience Appeal:** Identify your app's audience and why it matters to them.
2. **Problem and Solution:** Clearly define the problem your app solves and its real-world impact.
3. **Unique Selling Points (USPs):** Highlight what makes your app stand out from competitors.
4. **User Experience:** Show how the app is easy to use and fits into daily life or specific scenarios.

Individual App requirements

Essentially, we don't have any specific constraints regarding the app you propose to develop, as long as:

- The app is functionally complete in terms of its core functionalities. E.g., A chatting app must be able to facilitate chats, a game app must be playable, and a tool app must be able to complete its basic tasks.

It should look and behave like a complete software product intended for real users, rather than an unfinished prototype or a typical student programming exercise.

- It showcases your own thoughts in certain aspects, such as UI/UX design or the story behind the app etc. Just ensure it is not merely a copy or simulation of some existing apps, as that would be pointless.

- The workload is adequate for individual project.
